

QA Task: E-commerce Website Testing with Selenium Automation

Objective:

Conduct focused automated testing on critical functionalities of an e-commerce website to ensure reliability and user satisfaction. Key areas include categories browsing, products browsing, product search and the checkout process.

Website:

<https://magento.softwaretestingboard.com/men/tops-men/hoodies-and-sweatshirts-men.html>

Timeframe:

~3 days

Requirements:

- Test Case Creation
 - Design 3 test cases covering critical paths e.g (Product search, Adding items to cart, Completing a purchase, ... etc) or edge cases (e.g., invalid product search, invalid payment methods, ...etc).
 - Include objectives, expected outcomes, and pass/fail criteria.
- Automation
 - Automate the 3 test cases using Selenium with Java + TestNG + POM with applying the best practices to ensure script reliability and reusability.
 - Use Maven for dependency management.
 - Implement **basic test reporting** (e.g., TestNG reports).
 - Push code to GitHub and include a README with setup and execution instructions.
- Bug Reporting & Security Testing
 - Report any issues found, prioritizing those that impact user experience or functionality.
 - Perform basic security validation and report any found issue, focusing on:
 - Input validation
 - Common injection vulnerabilities (e.g., SQL injection, XSS)
